

*Terebra rubrobrunnea*, sp. nov.

Shell narrowly subulate, reddish brown; remaining whorls 21, very flat, sculptured with oblique, rather closely set transverse costæ interrupted by spiral striæ and two crenate sutural bands, the upper of which is much the broader; sutures scarcely impressed; columella descending in a curve, extending into a thick, projecting callus which joins the lip above; peristome sinuous, slightly reflexed; aperture narrowly ovate; canal short, re-curved.

Altitude	..	..	47 mm.
Diam., major	..	..	6 "
Aperture, alt.	..	..	6 "
" diam...	..	..	2 "

Habitat—Andaman Islands.

Allied to *T. fenestrata*, Hinds<sup>1</sup>; the transverse costæ in the present species are, however, closer together and not so coarse, the spiral striæ are also more numerous and not so well defined.
