

1. *Terebra canalis*, n. s.

Gedgrave. |

A few specimens in bad condition.

Sect. β . sinistral.

WOODS 1842/1840

CANALIS

WOOD 1842

Terebra canalis, S. Wood. To distinguish the next species from this, I subjoin a description of the shell, Mr. Wood not having given one in the Mon. Crag Mollusca:—

Shell dextral, conical, with a broad base; spire pointed, apex rather obtuse; whorls 11-13, sides nearly flat, the upper ones plicated; surface finely striated from apex to base; body-whorl rapidly contracting below; outer lip sharp, spreading towards the canal; canal recurved, open; pillar twisted, suture distinct. Long. $1\frac{1}{4}$ inch.

Columbella minor, Philippi, differs from this shell in size only.
