

Hastula jamaicensis, new species

(Plate 4, Figure 4)

Shell medium-sized, moderately slender. Outer lip descending almost vertically from suture. Siphonal fasciole worn on only specimen, bearing a broad shallow median groove. Sculpture consisting of narrow vertical axial ribs that undulate the suture and disappear near base of later spire whorls. ...

Length 17.9 mm.; diameter 5 mm. (holotype, apex broken).

This species is represented only by the holotype. It is smaller than the living West Indian *H. hastata* (Gmelin) and has flatter whorls, and its ribs disappear near the base of the later whorls of the spire. A more strongly sculptured species is represented by a specimen from the Cercado formation (U. S. G. S. station 8534).

Type material.—Holotype (U. S. Nat. Mus. No. 369350).
