

*Terebra (Noditerebra) pectinata* (VREDENBURG, 1921);  
Rec. Geol. Surv. India, p. 355, pl. 10, fig. 20.  
The present specimens are subfossil, with the proto-  
conch and early whorls missing, and a heavy black  
deposit on the shells. The basic color appears to be  
solid orange, with perhaps a white peripheral band on  
the body whorl. - Dredged in 50 fathoms in Tosa  
Bay, Japan; 1962. ex A. Teramachi Coll. R. D. Burch  
Coll. No. 507.

~~not a fossil~~  
BURTON 1964 p 248
