

DUPLICARIA

DALL 1908

T.S. DUPLICATA.

Genus DUPLICARIA Dall, 1908.

A. Sculpture persistent, suture channeled.

a. Shell axially ribbed, sulcate. *Duplicaria*.

Duplicaria Dall, 1908 (nov). *T. duplicata* Lam.

This is *Myurella* Troschel, not of Hinds.

DUPLICARIA DALL.

DUPLICARIA Dall, Nautilus, March, 1908, p. 124.

Shell small, acute, similarly sculptured throughout, with sharp, regular, numerous axial ribs crossing the flat whorls and divided by a conspicuous spiral sulcus; suture distinctly channelled; pillar with a single keel, the columellar lip not callous or raised, the canal obsolete, the aperture with no posterior channel. Type *Terebra duplicata* Lamarck.

This is *Myurella* Troschel, not Hinds. The anatomical characters have already been mentioned and forbid its consolidation with the other genera. It is the only group in the family with a channelled suture. DALL: 1908b

Duplicaria Dall, 1908, Nautilus 21 (11): 124. Type species, *Terebra duplicata* Lamarck, 1822=*D. duplicata* (Linnaeus, 1758), recent, Indo-Pacific. "Sculpture persistent, suture channelled. Shell axially ribbed, sulcate."

Genus *Duplicaria* Dall, 1908

Type species: *Duplicaria duplicata* (Linnaeus, 1758).

The characteristics of the species we place in this genus are the following: shell axially ribbed; subsutural groove cutting through ribs; suture well-marked; no spiral sculpture or very weak, microscopic spiral lines.

We are using the generic division based entirely on shell characters for the convenience of identification. Some of the species listed under *Duplicaria* have no radula, others have a radula which differs from that of *Hastula*.

Without being able to correlate shell characters with soft anatomical characters, there may be species that could fall in more than one of our divisions.

B & C 1987

Genus *Duplicaria* Dall, 1908

Type species, *Duplicaria duplicata* (Linnaeus, 1758)

The shell characteristics of the species we place in this genus are the following: shell axially ribbed; subsutural groove cutting through ribs; suture well marked; no spiral sculpture or very weak, macroscopic spiral lines.

We are using the generic division based entirely on shell characters for the convenience of identification. Some of the species listed under *Duplicaria* have no radula, others have a radula which differs from that of *Hastula*.

Without being able to correlate shell characters with anatomical characters, there may be species that could fall in more than one of our divisions. *D. raphanula* is one of those. It could as well be assigned to the genus *Hastula*, although recent authors have assigned it to *Duplicaria*.

Dall (1908, p. 125) and Bartsch (1923, p. 63) both erroneously attributed Lamarck as the author of *duplicata*.
